

A Quick Guide on how to Reconnect your System to the Internet:

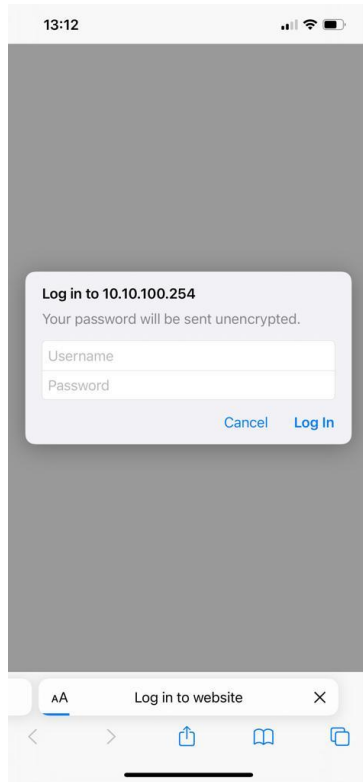

These steps must be done close to your inverter so you can keep connection with the inverters AP network

- Get the antenna box with your QR code on the side of it (usually left on the top of your inverter) – the password to connect to the AP network is also on this box.
- Go to Wi-Fi on your phone and search for a network that looks like this example – AP_1453687 (see picture no. 1)
- Once you are connected to this Wi-Fi network, go to the internet explorer on your phone and search for 10.10.100.254
- You will then be asked for a password and username (see picture no. 2)
 - username: admin
 - password: admin
- You will be brought into a settings menu – along the left side of your screen will be a list, click on “Wizard”
- The system will then search for nearby Wi-Fi networks available – click the desired network for your house (see picture no. 3)
- Once you have selected your Wi-Fi network, click “next” – you will be asked for the password for your home Wi-Fi – input this in the space provided (see picture no. 4)
- Click “next” on the next page and “next again” until the page tells you to click “OK” for the settings to take effect (see picture no. 5)
- The final step is to close the tab in the internet explorer (see picture no.6)

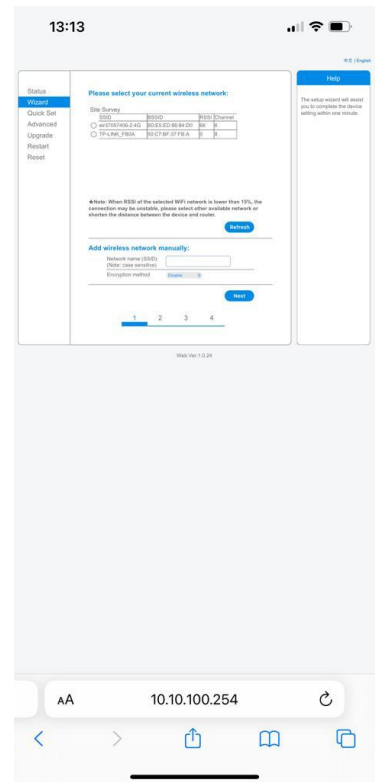

Your system should now be connected to your Wi-Fi network. To double check this you can go to the IP address again 10.10.100.254 and click on the “Quick Set” menu and you should be able to see your home Wi-Fi listed – if not, repeat the steps again
